1. Persiapan Data

Import library yang diperlukan

```
import pandas as pd
import numpy as np
import seaborn as sns
import matplotlib.pyplot as plt
import time
from itertools import product
from sklearn.model_selection import train_test_split, GridSearchCV
from sklearn.preprocessing import LabelEncoder, StandardScaler
from sklearn.ensemble import RandomForestClassifier
from sklearn.model_selection import ParameterGrid
from sklearn.metrics import accuracy_score, precision_score, recall_score, f1_score, confusion_matrix
from google.colab import drive
```

Sambungkan ke Google Drive dan arahkan ke path data yang akan digunakan

```
drive.mount('/content/drive')

path_data = "/content/drive/MyDrive/Bengkel Coding/Dataset/adult.csv"
```

```
Mounted at /content/drive
```

Baca dataset

Pada data yang kita gunakan kali ini, tantangannya adalah bahwa data ini masih belum memiliki nama kolom, maka nanti akan kita beri nama pada kolomnya termasuk akan kita analisis mengenai langkah apa saja yang akan kita gunakan dalam melakukan pre-processing data

```
df = pd.read_csv(path_data)
df.head()
```

	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical	Not-in-family	White	Male	2174	0	40	United-States	<=50K
0	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband	White	Male	0	0	13	United-States	<=50K
1	38	Private	215646	HS-grad	9	Divorced	Handlers-cleaners	Not-in-family	White	Male	0	0	40	United-States	<=50K
2	53	Private	234721	11th	7	Married-civ-spouse	Handlers-cleaners	Husband	Black	Male	0	0	40	United-States	<=50K
3	28	Private	338409	Bachelors	13	Married-civ-spouse	Prof-specialty	Wife	Black	Female	0	0	40	Cuba	<=50K
4	37	Private	284582	Masters	14	Married-civ-spouse	Exec-managerial	Wife	White	Female	0	0	40	United-States	<=50K

Langkah berikutnya: Buat kode dengan df | Lihat plot yang direkomendasikan | New interactive sheet

```
df.tail()
```

	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical	Not-in-family	White	Male	2174	0	40	United-States	<=50K

2. Pre-Processing Data

Memberikan nama kolom pada data

```
col_names = ['age', 'workclass', 'fnlwgt', 'education', 'education_num', 'marital_status',
             'occupation', 'relationship', 'race', 'sex', 'capital_gain', 'capital_loss',
             'hours_per_week', 'native_country', 'income']
```

```
df.columns = col_names
df.head()
```

	age	workclass	fnlwgt	education	education_num	marital_status	occupation	relationship	race	sex	capital_gain	capital_loss	hours_per_week
0	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband	White	Male	0	0	13
1	38	Private	215646	HS-grad	9	Divorced	Handlers-cleaners	Not-in-family	White	Male	0	0	40
2	53	Private	234721	11th	7	Married-civ-spouse	Handlers-cleaners	Husband	Black	Male	0	0	40
3	28	Private	338409	Bachelors	13	Married-civ-spouse	Prof-specialty	Wife	Black	Female	0	0	40
4	37	Private	284582	Masters	14	Married-civ-spouse	Exec-managerial	Wife	White	Female	0	0	40

Langkah berikutnya: Buat kode dengan df | Lihat plot yang direkomendasikan | New interactive sheet

```
df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 32560 entries, 0 to 32559

```

Karena data dengan tipe kategorikal bentuknya masih berupa object dan belum berupa angka, maka selanjutnya kita perlu untuk mengubah agar tipe dari record yang bertipe object menjadi bertipe angka, kita akan menggunakan label encoder dari pustaka sklearn

```
from sklearn.preprocessing import LabelEncoder
kolom = ["workclass", "education", "marital_status",    "occupation",   "relationship", "race", "sex", "native_country",    "income"]

le = LabelEncoder()

for col in kolom:
    df[col] = le.fit_transform(df[col])
df.head()
```

	age	workclass	fnlwgt	education	education_num	marital_status	occupation	relationship	race	sex	capital_gain	capital_loss	hours_per_week	na
0	50	5	83311	9	13	2	3	0	4	1	0	0	13	
1	38	3	215646	11	9	0	5	1	4	1	0	0	40	
2	53	3	234721	1	7	2	5	0	2	1	0	0	40	
3	28	3	338409	9	13	2	9	5	2	0	0	0	40	
4	37	3	284582	12	14	2	3	5	4	0	0	0	40	

Langkah berikutnya: Buat kode dengan df | Lihat plot yang direkomendasikan | New interactive sheet

untuk kolom target (income) ketika penghasilan <= 50k maka diubah ke angka 0, dan jika penghasilan > 50k diubah ke angka 1

Melakukan Pengecekan Missing Value

```
missing_values = df.isnull().sum()
print(missing_values[missing_values > 0])
```

```
Series([], dtype: int64)
```

```
df.describe()
```

3. Pemodelan

di sini kita akan menggunakan model Random Forest, kenapa Random Forest?, karena pada hasil pengujian yang telah saya lakukan, Random Forest yang berhasil mendapatkan akurasi tertinggi dibandingkan dengan model-model lainnya

```
# pisahkan fitur dan target
X = df.drop("income", axis=1)
y = df["income"]

# bagi data menjadi train-test
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42, stratify=y)

# normalisasi fitur numerik
scaler = StandardScaler()
X_train = scaler.fit_transform(X_train)
X_test = scaler.transform(X_test)

# handling data yang tidak seimbang
sampling_methods = {
    "No Sampling": None
}

# model yang akan digunakan
models = {
    "Random Forest": RandomForestClassifier()
}

# hyperparameter
param_grid = {
    "Random Forest": {
        "n_estimators": [200],
        "max_depth": [15],
        "min_samples_split": [5],
        "min_samples_leaf": [1],
        "max_features": [None]
    }
}

# dictionary untuk menyimpan hasil terbaik
best_results = {"accuracy": 0, "params": None, "model": None, "method": None, "y_pred": None}

# loop untuk setiap metode sampling
for method_name, sampler in sampling_methods.items():
    print(f"\n==== Menggunakan {method_name} ====")

    # jika metode "No Sampling", gunakan data asli
    if sampler is None:
        X_resampled, y_resampled = X_train, y_train
    else:
        X_resampled, y_resampled = sampler.fit_resample(X_train, y_train)

    # loop untuk setiap model
    for model_name, model in models.items():
        print(f"\n>> Training {model_name} dengan {method_name}")

        # loop untuk setiap kombinasi hyperparameter
        for params in ParameterGrid(param_grid[model_name]):
            start_time = time.time()  # mulai waktu eksekusi

            # set parameter pada model
            model.set_params(**params)

            # training model
            model.fit(X_resampled, y_resampled)

            # prediksi
            y_pred = model.predict(X_test)

            # evaluasi
            accuracy = accuracy_score(y_test, y_pred)
            precision = precision_score(y_test, y_pred, average="binary")  # Sesuai jenis data
            recall = recall_score(y_test, y_pred, average="binary")
            f1 = f1_score(y_test, y_pred, average="binary")

            # waktu eksekusi per kombinasi
            elapsed_time = time.time() - start_time

            # print hasil tiap kombinasi
            print("\n✅ Parameter yang digunakan:", params)
            print(f"📊 Akurasi: {accuracy:.4f} | Precision: {precision:.4f} | Recall: {recall:.4f} | F1-Score: {f1:.4f}")
            print(f"⏳ Waktu Eksekusi: {elapsed_time:.2f} detik")
            print("-" * 50)

            # simpan hasil terbaik
            if accuracy > best_results["accuracy"]:
                best_results.update({
                    "accuracy": accuracy,
                    "params": params,
                    "model": model,
                    "method": method_name,
                    "y_pred": y_pred
                })

# tampilkan hasil terbaik
```

```
# tampilkan hasil terbaik
print("\n🎯 **Kombinasi Parameter Terbaik** 🎯")
print(f"🔷 Sampling Method: {best_results['method']}")
print(f"🔷 Model: {best_results['model'].__class__.__name__}")
print(f"🔷 Parameter: {best_results['params']}")
print(f"📊 Akurasi Terbaik: {best_results['accuracy']:.4f}")
```

```

🔷 Model: RandomForestClassifier
🔷 Parameter: {'max_depth': 15, 'max_features': None, 'min_samples_leaf': 1, 'min_samples_split': 5, 'n_estimators': 200}
📊 Akurasi Terbaik: 0.8735
```

```
# confusion matrix
cm = confusion_matrix(y_test, best_results["y_pred"])
plt.figure(figsize=(6, 5))
sns.heatmap(cm, annot=True, fmt="d", cmap="Blues", xticklabels=["Negative", "Positive"], yticklabels=["Negative", "Positive"])
plt.xlabel("Predicted Label")
plt.ylabel("True Label")
plt.title("Confusion Matrix - Best Model")
plt.show()
```

dari hasil conf matrix di atas dapat kita simpulkan bahwa:

1. terdapat 4678 data yang memiliki class negatif dan terklasifikasi sebagai bagian dari class negatif (**Benar**)
2. terdapat 266 data yang memiliki class negatif namun terklasifikasi sebagai bagian dari class positif (**Salah**)
3. terdapat 1010 data yang memiliki class positif dan terklasifikasi sebagai bagian dari class positif (**Benar**)
4. terdapat 558 data yang memiliki class positif namun terklasifikasi sebagai bagian dari class positif (**Salah**)

sebelumnya kami telah melakukan pengujian dengan hyperparameter tuning untuk mencari model terbaik sekaligus mencari parameter-parameter terbaik yang pada akhirnya kami pilih sebagaimana di atas, sehingga yang kami gunakan pada source code ini adalah hasil final dari pengujian kami sebelumnya. adapun data yang kami proses kali ini yaitu dengan melakukan penggantian terhadap kolom yang memiliki value "?" kemudian kami ganti dengan kelas mayoritas. kami telah melakukan pengujian jika value "?" tidak dihapus dan diproses apa adanya, adapun hasil yang kami dapatkan sebagai berikut:

🔷 Sampling Method: No Sampling

🔷 Model: RandomForestClassifier

🔷 Parameter: {'max_depth': None, 'max_features': 'sqrt', 'min_samples_leaf': 2, 'min_samples_split': 10, 'n_estimators': 50}

📊 Akurasi Terbaik: 0.8733

selain itu kami juga telah melakukan pengujian jika data yang memiliki value "?" dihapus dan tidak digunakan, berikut hasil yang kami dapatkan:

🔷 Sampling Method: No Sampling

🔷 Model: RandomForestClassifier

🔷 Parameter: {'max_depth': None, 'max_features': 'sqrt', 'min_samples_leaf': 2, 'min_samples_split': 10, 'n_estimators': 200}

📊 Akurasi Terbaik: 0.8729
